

Overview

The **inventory management** in Surface Solutions serves as the central hub for maintaining and organizing all materials and colors in your company. It forms the basis for calculations, offers, orders, and automated requirements determination.

In inventory management, all important information about your materials is recorded and monitored: name, gloss level, surface structure, price per kilogram, stock level, reserved quantities, quantities in delivery, minimum stock level, and minimum purchase quantities.

Inventory management thus ensures that all materials are always available, stock levels are monitored transparently, and purchases can be executed efficiently based on an optimized algorithm.
